Solubility: Albumins are readily soluble in water and can only be precipitated by high concentrations of neutrals salts such as ammonium sulfate. The solution stability of BSA is very good (especially if the solutions are stored as frozen aliquots). Albumins are frequently used as stabilizers for other solubilized proteins. However, albumin is readily coagulated by heat (50°C or above). It forms aggregates which do not revert.

ADDITIONAL INFORMATION: This material does not contain, nor is derived from Specified Risk materials as defined in Commission decision 97/534/EC.
